Besides, young people right now are all excellent supporters, but never activists. Along with the spread of Facebook or Twitter, you can quickly advocate a claim or support each other with 'Like' or 'tweets'. It is a high-return investment: with just a single click, you can represent your support to reform, care about the environment and love for minorities and at the same time, relieve your guilt for not doing anything. "I have already done my best", you can comfort yourself like this. However, even though the minorities are flattered with your support, they are still fighting alone. Support is important (of vital importance), but what we value the most is the action. Sometimes we miss old times teenagers, those built barricades in the streets of Paris in French Revolution or took off his own coat and give it to you in a cold winter night, 1940's Beijing. They could not learn others' difficulties quickly and comprehensively like we do today. However, once they met a person in need, they would instantaneously lead a helping hand.

2014 年 9 月号

What is more, young people now are victims of conformity. They will take action unless everyone is doing it. No one dares to be the first to lend his seat to an old grandpa on bus or the first to stop and gather a falling grandma up. They do not want others' staring with praise or misunderstanding. They do not want to suffer the pain that pioneers might encounter. The society, lack of mutual trust and honesty, is turning its promising young adults into creatures of cowardice and pathetic. Living such society, no wonder our young people are less likely to help others.

As for the job-effected people, job is not only a work to support themselves, but a way we use to bring us a stronger sense of accomplishment and achievement. Happy and fulfilled as we are when we deliver outstanding performance at work. Meanwhile, when we thrive at work, we may earn high salary with which we can give our loved ones a better quality of life. Seeing the smiles on their face, it will bring considerable joy to us either. Yet there is still one thing that can make us happier, that is the harmonious relationship with workmates. It is because we spend far more time with our workmates than any other friends during leisure time.

With the rapid development in interne, computer and other technologies, people have more and more options for their career path as well as working locations since these development shorten the distance between different people and companies. Therefore, **there is a universal awareness** that working at home with accompany of computer and telephones is better than working in a normal office, in my opinion, such statement cannot afford further analysis for the

following reasons.

2014 年 6 月号

However, the notion that “advertisement always make us disappointed” sometimes results from consumers’ **unrealistic expectation** of products. Advertising easily makes people imagine the “perfect” products which are not realistic at all, but consumers would rather keep this unreasonable hope. Then they would be **inevitably** disappointed by the actual products which cannot be so perfect, and attribute the cause to advertising. But it is actually the unrealistic expectation that **eclipses** any product, because a perfect image is absolutely subjective and could not even be realized. For example, I once signed up for a group tour to Lantau Island in Hong Kong, being attracted by the beautiful landscape pictures posted in the advertisements. But **later on** in the journey I was disappointed because the actual scenery was never as attractive as what I had **expected**. Therefore, an unrealistic expectation **is to be avoided** in making any buying decision.

Without a doubt, environment matters. A clean and beautiful environment **concerns the health of everybody**-the working men and women, children, our bright future, and the elderly. Atmosphere full of dust and toxic gas will lead to lung disease; water without careful disinfection will lead to bacteria disease; food grew in poisoned soil or suffered from excess pesticide will lead to all kinds of disease to human’s organisms and eventually, destroys them. Environment is one of the major factors to one’s health or, survival. Government must pay 100 percent attention to it otherwise one day the country could no longer develop because their people die out. It is responsible for its citizens’ health and happiness, two essential parts of life that environment both play important roles in, so they must take action. To protect the environment is to protect the country’s brighter future

Another reason for the decrease in cars, as far as I am concerned, is the improvement in its alternatives. In order to solve traffic problem, government had implemented a gamut of proposals in the improving conditions of buses, subways and railways. Take the subway for example. People are **encouraged** to take subways because of its reasonable price, its better environment and more importantly, its punctuality. As more and more people are choosing subways over cars, it is evident that in 20 years, there will be fewer cars on the street.

2014 年 3 月号

First and foremost, **the headache of** traffic jam is the **primary reason** for the decrease in ownership of cars. In the past decade, the city, whether in

developing or developed countries, had witnessed a booming economy, a flourishing civilization, and unfortunately, a ballooning traffic jam. Almost all city dwellers are bothered more or less by traffic jams, which kept them away from being a punctual worker, a punctual date, or a punctual friend. Consider how many people are scolded by their bosses, dumped by their dates, or criticized by their friends, simply because of being late. And why were we late? None of us intended to be a late bird, not to mention plotting it. More often than not, it is the traffic jams to blame. And what will happen if the victims of traffic jams are hurt again and again? They stop driving cars, and advise their children and friends to take buses or subways instead of cars. Indeed, this tendency agrees with a principle of economics: when there is excessive supply-that is, more cars than the road can take-there will be a decrease in this supply. Therefore, the result of traffic jams is a gradual decrease in the car ownership.

Admittedly, it is undeniable that within the range of school, the teaching quality mainly due to the influence of teachers in class. In the first place, teachers would be responsible for all different kinds of courses absorbed by the students, to name a few, physics, mathematics and English. These subjects and technology would be of vital importance for the career path and intelligence development of children. What's more, teachers would also make impact on students' mental health. For example, they need to provide guidance and mental caring especially when students are facing with obstacles and difficulties in their lives. To some extent, increasing in the compensation of educators would make them more committed as well as focused on the main task of teaching thus increasing the quality of education.

The major reason for my propensity for space technology is the potential of scientific research. No matter how the impact it occurred, from the movement of its advent, scientific research had become the very dictator of our future. It is by these researches that human beings, the only creature with intelligence on earth, began to soar their wings of aspiration. And more importantly, it had indeed done a great good for the humankind. Can you imagine getting access to the world wide web at your desk if there were not for the research of millions of computer ancestors? Similarly, it is highly probable that the great-grandchildren of your great-grandchildren would be enjoying a trip across the "worm hole" while giving thanks secretly to his forefather, you, who voted for the expenditure on scientific research. In a word, the space project enjoys great potential, and should therefore be taken into account in top priority to ensure a better future of mankind.

First of all, good friend will share every detail of the journey with you, your

excitement, your satisfaction, your tiredness and even the unpleasant little quarrel you had with the guy **jumped the queue**. He will teach you all the tricky poses to make before a camera and then laugh at your funny face when going through the pictures, he will tell you funny **anecdotes** about the site and play little game with you when you are bored, he will lend you a shoulder when you are tired and buy you a drink when you are thirsty. Even though he does not offer any major help to your trip, he is there all the time, experiencing everything with you and telling you by his accompany, you are not alone.

2013 年 11 月号

Many people regard college as a place for students **bending on** study. It is also true that students will get professional knowledge on **theoretic** study to prepare for their future career. However, the more effective way is to **link theory with practice**, which means it is of vital importance for students, colleges, and even the whole society do have job preparation classes for students before their first job.

Apparently, school is not only a place for just teaching us knowledge from the books, but also a place to help us **build our character as well as direct our future orientation**. The career courses function as a guide to our future job selection, thus universities should pay sufficient attention to it.

2013 年 10 月号

The courses are mutual beneficial for not only the students but also the university. **Increasing employment rates of graduates** largely boost the school's reputation among its potential application, thereby, the school will attract better students. What's more, the successful graduates are likely to donate more money for the better future of their mother school, just thinking about the Ivy League's funds and their great reputations in the whole world. So, there is no excuse for school not to take advantages of the resources to help students a better development in career.

Lastly, the professor points out that international agencies and laws are only valid for open sea. But mining companies choose coastal areas of a particular country as mining location which are managed by the government of this country rather than by the laws. Therefore the laws are not helpful to confine the mining companies. The reading passage, in contrast, indicates the international agencies and laws could regulate mining firms in case of polluting the environment.

2013 年 8 月号

Secondly, the professor argues that harmful minerals and chemicals will spread out through water even if the mining spot is within 2000 kilometers from the volcanic vent. And these minerals and chemicals would drift back towards the

vent, which means that the ecosystems near the vent would be disturbed and the consequences are long-term. The reading passage, by comparison, suggests that ecosystems nearby would not be affected.

2013 年 7 月号

In the lecture, the professor casts doubt on the reading passage that deep-sea mining is hopeful.

First of all, according to the lecture, although there are rich scarcely metals near the volcanic vent of seabed, immediate technology for deep-sea mining is undeveloped and the metals from the mining are not always available. For example, it is hard to separate metals from sediments in terms of collecting technology. Moreover, transferring the metals out of sea is not easy with respect to transportation.

A clear career goal is the cornerstone of student's future development. Providing a targeted course about career planning can give orientations of students' suitable occupation development. Introductions for proper fields may inspire students' interests on acquiring more specific knowledge by themselves. Also this process will build a bridge from the tower of ivory to a real society. Adequately preparations and practical skills will be taught about dealing with the relationships with interviewers or workmates in the future. Thus, students benefit a lot for deeper comprehension about career and their suitable jobs.

2013 年 5 月号

What is more, even though I am truly a food lover, I value more about the historical and art meaning of the sites. As a Chinese old saying goes, travelling ten thousand miles and reading ten thousand books is the top idea for people. The sites are like huge history books lying there, waiting for us to read. They lead us into a great art class, showing us either natural sights or extremely skillful artificialities. Besides, the purpose for travel is to extend my outlook. Food is certainly one way to do that, but it only constitutes a small part of how we can experience the local cultures. And friends are surely great for the company, but they can also keep your mindset trapped in familiar territory while abroad.

2013 年 4 月号

But the norm that a "good" product is advertised as a "better" one is often challenged or even reversed – that is, unscrupulous businessmen make use of advertising to sell inferior products, which raises a moral question. For example, my mother was once attracted by a commercial of an encyclopedia which was claimed to be the one and only complete version of several ancient Chinese documents. She rushed to shop and bought this "limited version" at an eye-popping price, and regarded it as one of the most precious things in our house.

However, a few months later she found the same version was sold in bulk at another shop at an unbelievably low price, which annoyed her for quite a long time. We can learn from the experience that we should not always trust the advertisements that are apparently exaggerating products, and keep alert in the swarm of television commercials.

2013 年 3 月号

The last factor that has made our age so uncomfortable is the abusive use of technology. Although it brings much convenience, it essentially changes human -- we are no longer the master of tools, but instead slaves of devices. We rush to metro station in order to catch an early train, sit in front of the radioactive computers (monitors) all day long in order to get our work done, and stay in air-conditioned rooms all summer without experiencing the natural changes outside thick cement walls. Several decades ago, people could still live closer to nature and make rational (sensible) use of modern technology, which to me is the essence of human living experience.

2013 年 2 月号

Another discomfort of our age is that we are experiencing interpersonal alienation. With the development of communication technology, people in fact become alienated with relatives and friends, since they could be merely accessed via phone or e-mails. Too often we feel that few of our friends are true friends, without the traditional feeling of mutual affection which could only be created by longtime apart. But several years ago, people treasured their friends and maintained relatively close interpersonal relations, which is much more enjoyable than the estrangements we are experiencing.

2013 年 1 月号

Also, students would easily become disoriented in the huge sea of information. Although modern technology could equip us with easy access to information, the huge amount of resources would actually leave us discombobulated. Therefore, it is only left to possess information more quickly, rather than learn it more quickly. An illustrating example is my experience with a HK digital library which stores almost all the books I desire. At first, I enjoyed downloading them from the database. However, one month later I ended up with hundreds of books stored in my hardware yet none of them finished or ever clicked.
